

Assessment Criteria for Simulation Track

Track: Simulation | Document Type: Assessment

Intern performance in the Simulation track is evaluated based on technical aptitude, creativity, and collaboration. Interns are assessed on their ability to model complex systems using tools like MATLAB, Simulink, or Python-based simulation libraries. Projects require a structured approach, and interns must demonstrate proficiency in analyzing simulation results for automotive or logistics systems. Regular reviews by mentors ensure alignment with project goals. Communication skills are evaluated during presentations and documentation submissions. The assessment process also considers adaptability and problem-solving, ensuring interns can handle challenges effectively. Feedback sessions are conducted to support learning and professional growth.
