

Technical Stack for Robotics Internships

Track: Robotics | Document Type: Technical Stack

Robotics internships at BMW Group involve working with hardware and software technologies to develop intelligent systems. Interns use programming languages like C++, Python, and ROS (Robot Operating System) for robot control and automation. Exposure to sensors such as LiDAR, cameras, and IMUs is essential for navigation and environment perception. Tools like Gazebo and RViz are used for simulation and visualization. Interns are encouraged to learn machine learning techniques for enhancing robot intelligence. Experience with embedded systems and microcontrollers is advantageous. BMW Group provides access to advanced robotics labs, fostering an environment for experimentation and innovation.
